1. Write a script (in the split-page format) for a 4-8 minute video about a *process* of some sort.

2. You can choose anything that involves steps or stages of an activity. Examples:
   - Cooking a dish or meal
   - Assembly of a product
   - Repair of a product
   - A homework assignment
   - What someone does in their job
   - A recreational activity
   - A sport
   - Washing a car
   - How to __________
   - Etc.

3. You will shoot, capture, edit, compress, and delivery this video as your final project.

4. Be sure to decide on your final delivery method before writing the script, as it may impact the details of your visual choices.

5. Don’t forget to include music or sound effects on the script, if you plan to use them.

6. Remember that a script does not always represent the exact program you end up with after the editing process is complete, so you are not necessarily locked into every decision you make now. The script, however, will be your guide in shooting and planning, so be as detailed as possible in this stage and consider your decisions carefully.

Note: Even if your choice of delivery method will be digital tape, the completed project will have to be compressed and submitted via either CD, DVD, or online, as well, so as to provide you with experience compressing video and delivering video via a non-tape method. See Course Project #3 for details.
